## 1 Single Source ER Diagrams

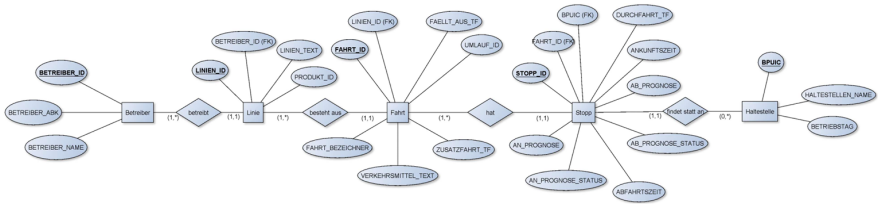

Fig. 1: Entity relationship diagram of the SBB rail data

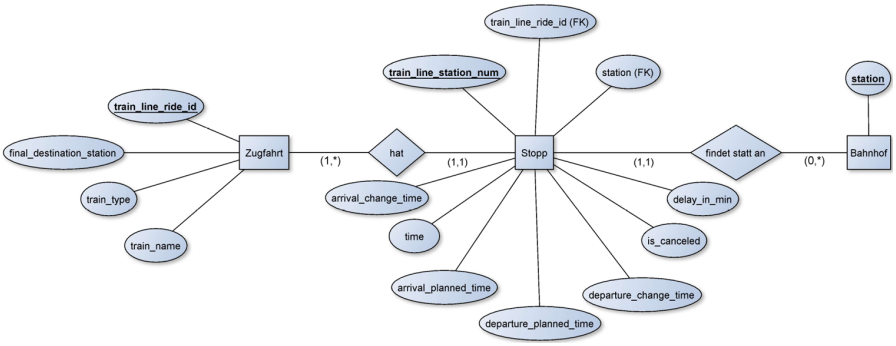

Fig. 2: Entity relationship diagram of the DB rail data

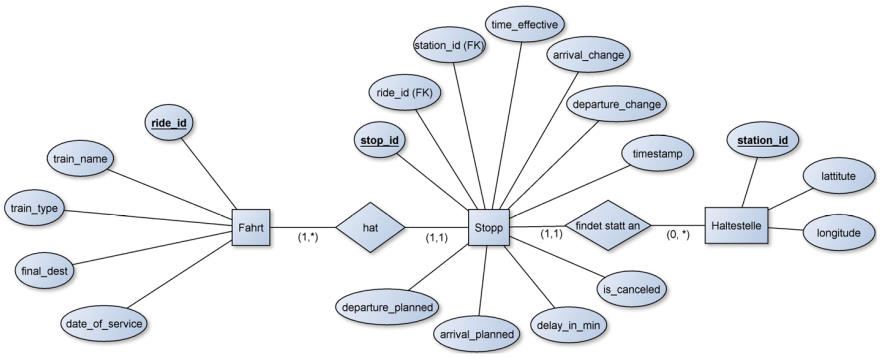

Fig. 3: Entity relationship diagram of the HSP rail data

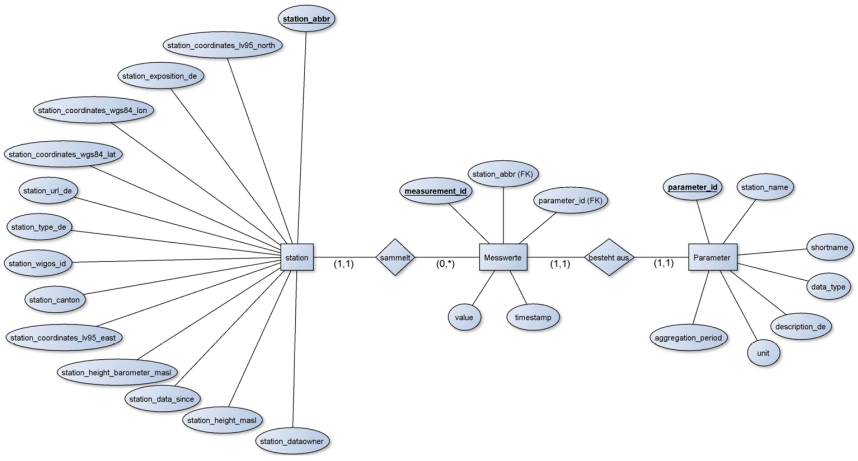

Fig. 4: Entity relationship diagram of the Swiss weather data

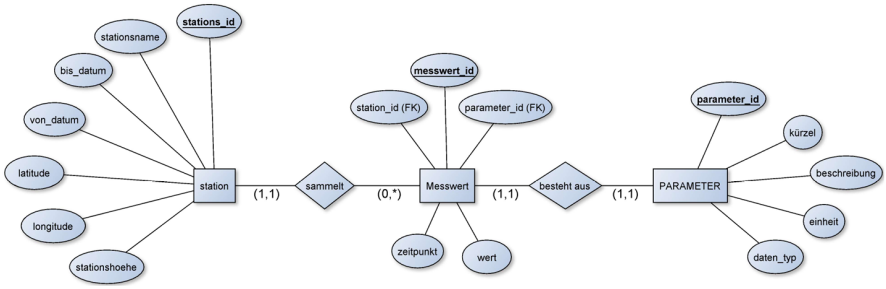

Fig. 5: Entity relationship diagram of the German weather data

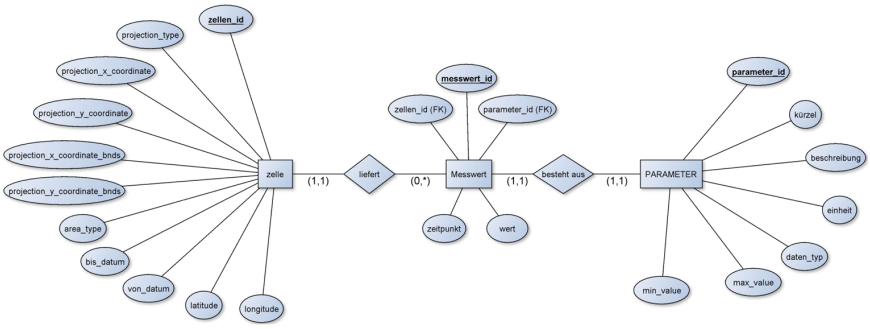

Fig. 6: Entity relationship diagram of the British weather data

## 2 Integrated ER Diagram

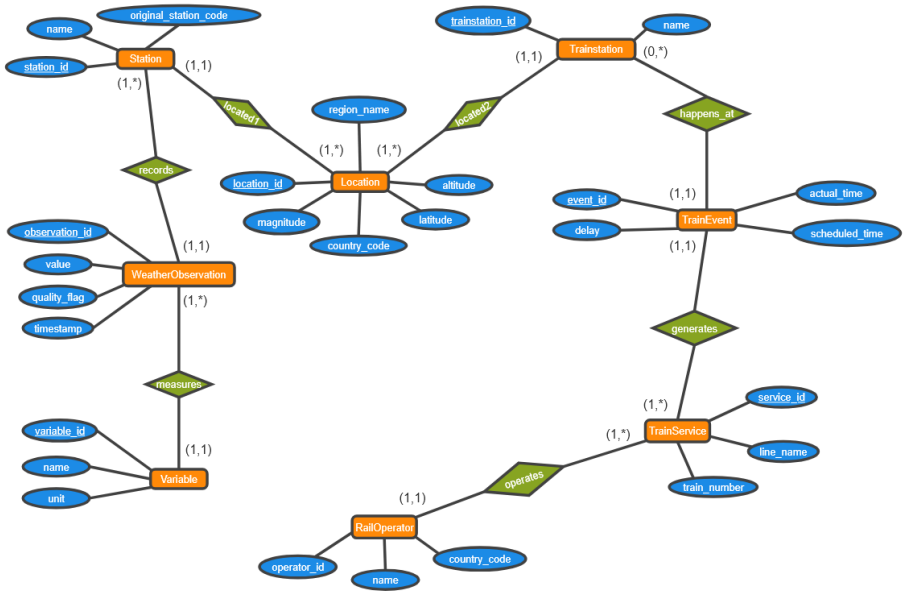

Fig. 7: Entity relationship diagram of the integrated schema

## Relational Schema

Stations (station_id, location_id, name, original_station_code)
Variables (variable_id, observation_id, name, unit)
WeatherObservations (observation_id, station_id, value, quality_flag, timestamp)
Locations (location_id, region_name, country_code, altitude, latitude, longitude)
TrainStations (trainstation_id, location_id, name)
TrainEvents (event_id, trainstation_id, service_id, delay, actual_time, scheduled_time)
TrainServices (service_id, line_name, train_number)
RailOperators (operator_id, service_id, name, coutry_code)

## 3 Normalized Relational Schema

The way we created our integrated ER diagram leads to the resulting relational schema to be already sufficiently normalized. This is because the onlything that derives anything is the artificial primary keys. This directly leads the relational schema to be in BCNF.

As we have not made any changes to the relational schema, the normalized ER diagram is still the one in Figure 7.
